

Intra-ACP Climate Services and Related Applications Programme

ClimSA COP29 - Side Event: 18 November 2024
Pavillon Francophonie

Innovating Climate Services: Building Capacity for the Future

INTRA-ACP CLIMATE SERVICES AND RELATED APPLICATIONS PROGRAMME

An initiative of the Organisation of African, Caribbean and Pacific States funded by the European Union

Dr. DIEUDONNE NSADISA FAKA
TITLE: Team Leader
PROGRAMME: ClimSA
ORGANISATION: OACPS SECRETARIAT

OUTLINE OF **CONTENT**

01 Objectives of side event

02 ClimSA Capacity Building Strategy

03 Implemented Action Plan

04 Innovative Climate Services: path forward

05 Discussion & Recommendations

**Building Domestic
Capacity for an
Effective Adaptation
and Resilient
Economic
Development**

SIDE EVENT

AT COP29

**in Small Islands Developing
Countries of the African,
Caribbean and Pacific States**

Objectives of the side event:

- **Raising awareness for the need of domestic capacity for sustainable climate action**
- **Discuss the innovative solutions to build domestic capacity**
- **Make recommendations to promote capacity building**

02

ClimSA Capacity Building Strategy

The Need for Climate Services: Challenges and Opportunities

1 Increasing Demand for Actionable Climate Information

As the impacts of climate change become more severe, there is a growing need for reliable, tailored climate services to support decision-making across sectors.

2 Bridging the Gap Between Science – Practice – Policy

Effective climate services require bridging the divide between climate science and the practical needs of end-users, such as policymakers, businesses, and communities.

3 Addressing Complex, Interdisciplinary Challenges

Developing climate services involves navigating a web of interconnected social, economic, and environmental factors, necessitating a holistic, interdisciplinary approach.

Challenges Facing the Climate Services Industry

1 Data Fragmentation

Climate data is often dispersed across multiple sources, making it challenging to integrate and derive meaningful insights. Overcoming this fragmentation is crucial for providing comprehensive and coherent climate services.

2 Limited Accessibility

Many climate services are not easily accessible or user-friendly, particularly for non-technical stakeholders. Improving the usability and accessibility of climate information is essential for widespread adoption and informed decision-making.

3 Skill Gaps

The climate services industry faces a shortage of professionals with the necessary interdisciplinary skills, including data science, climate science, and communication. Bridging these skill gaps is crucial for driving innovation and meeting the growing demand for climate-smart solutions.

4 Lack of Collaboration

Effective climate services often require cross-sectoral collaboration, but silos and a lack of coordination can hinder progress. Fostering stronger partnerships and knowledge-sharing is key to unlocking the full potential of climate services.

The Need for Climate-Smart Solutions

Increasing Extreme Weather Events

The frequency and intensity of extreme weather events, such as heatwaves, droughts, and floods, are on the rise, posing significant threats to communities and economies worldwide. Climate services are essential in providing the data, insights, and tools needed to mitigate these risks and build resilience.

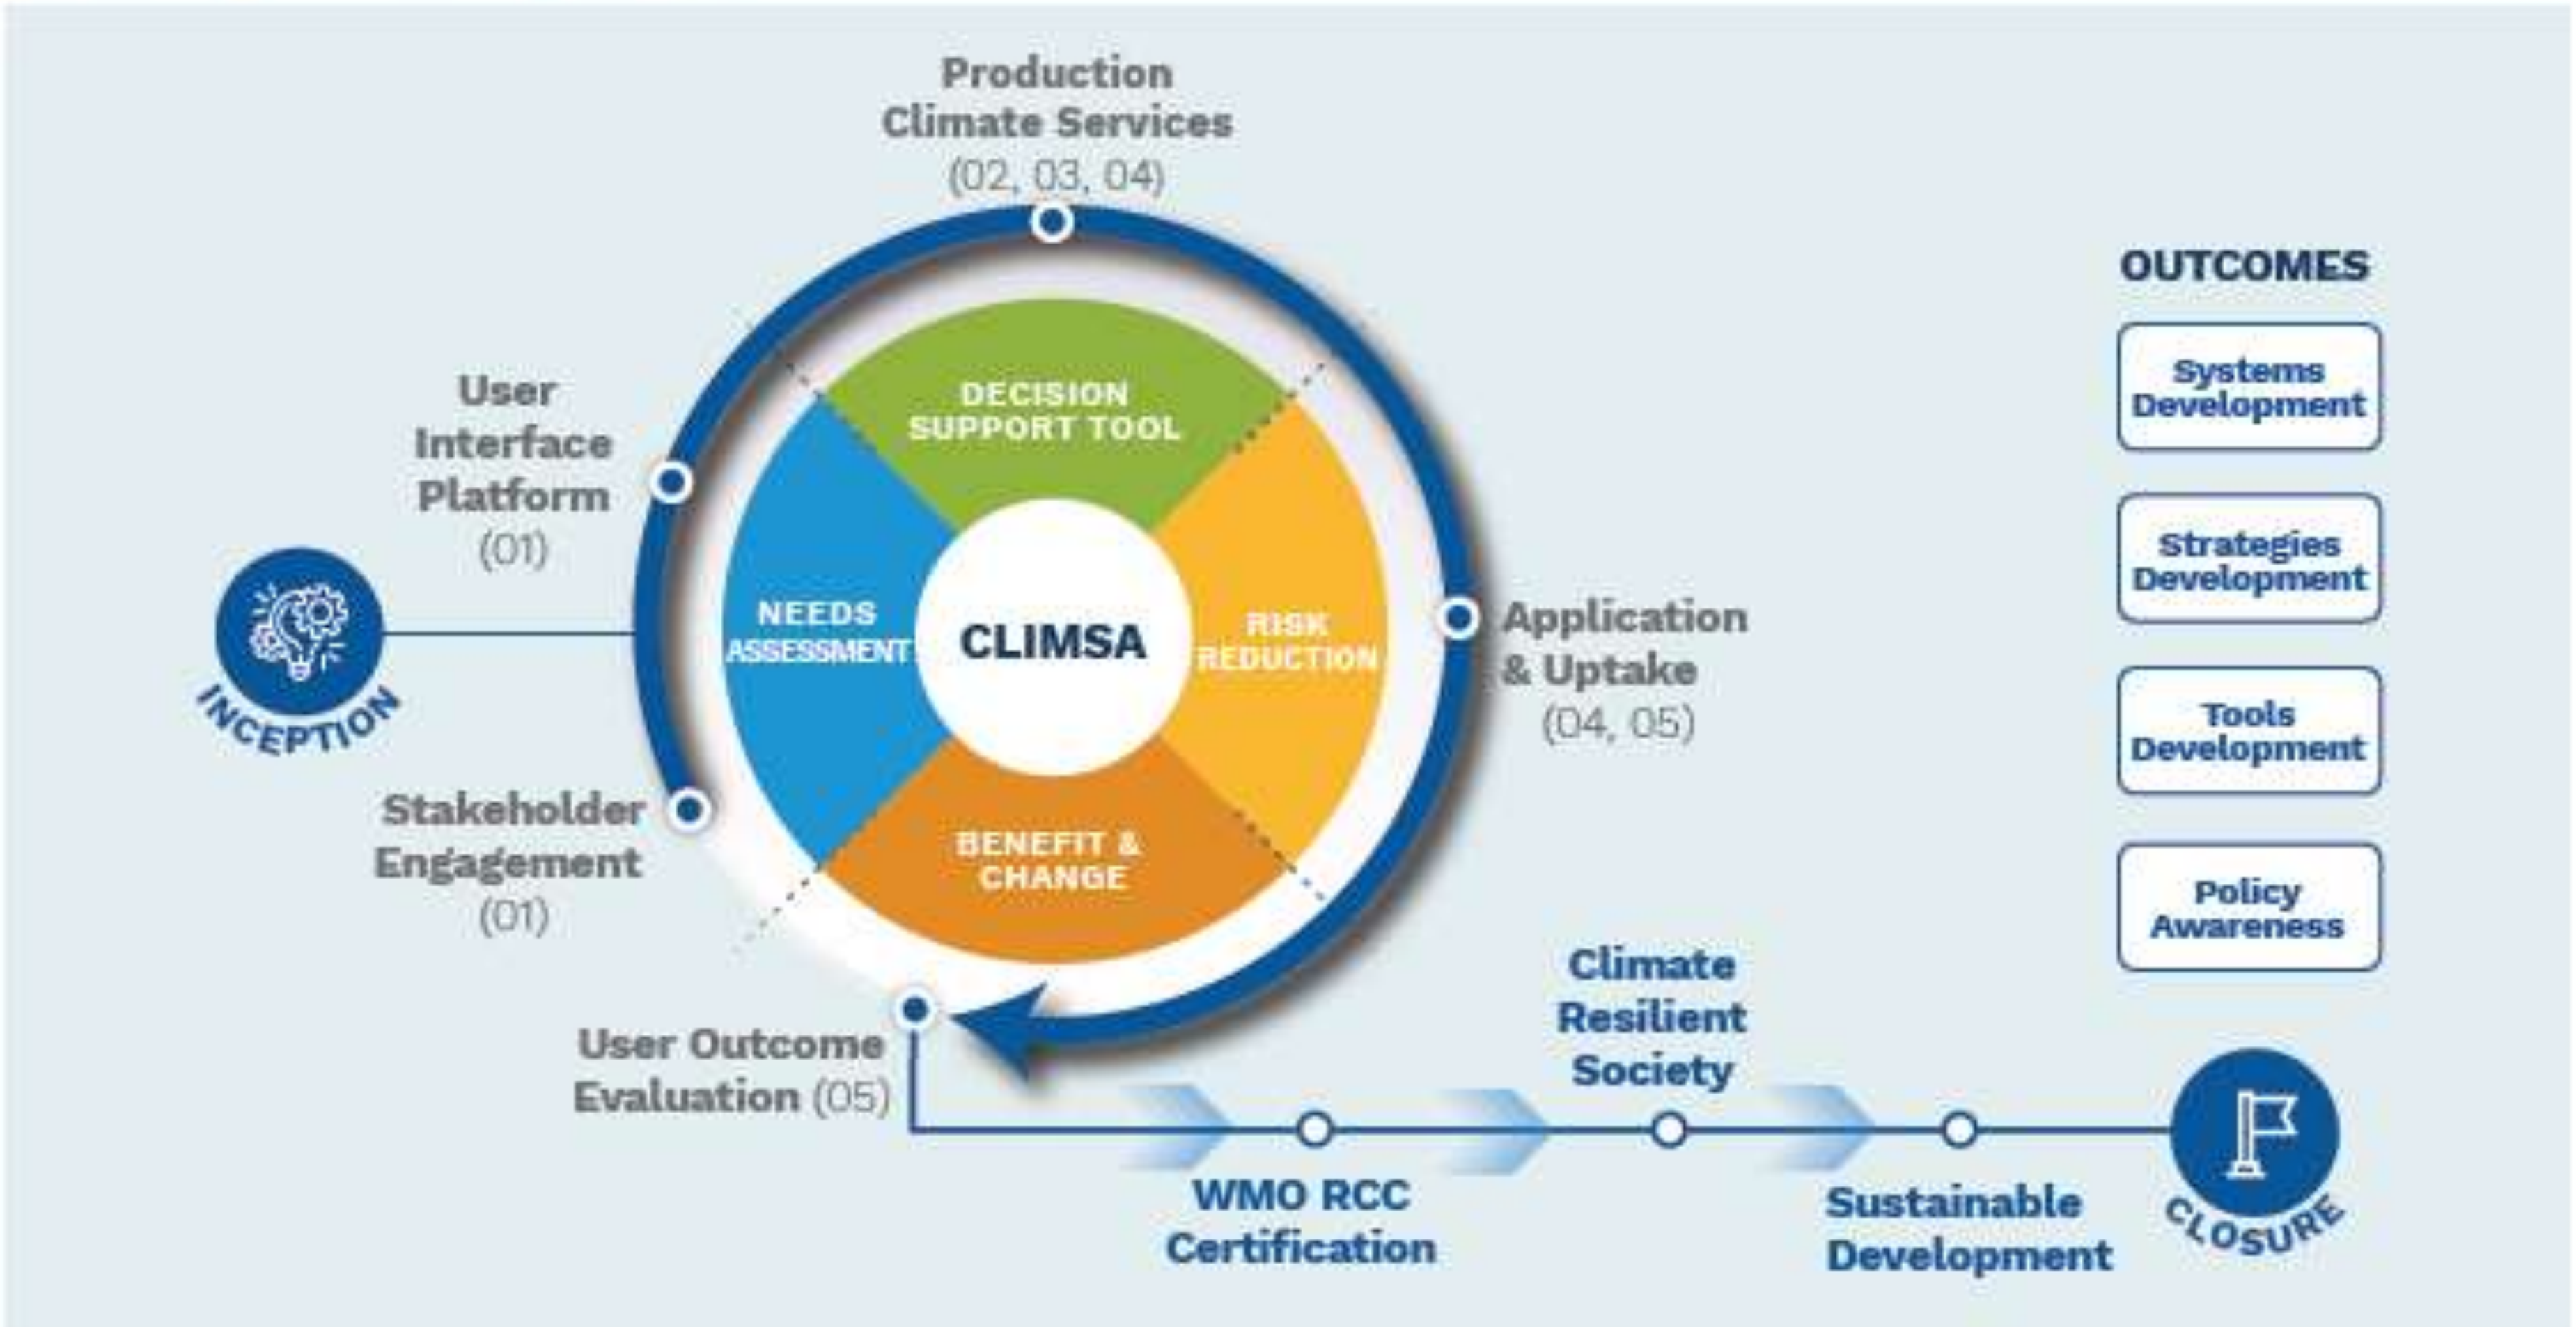

Growing Demand for Actionable Information

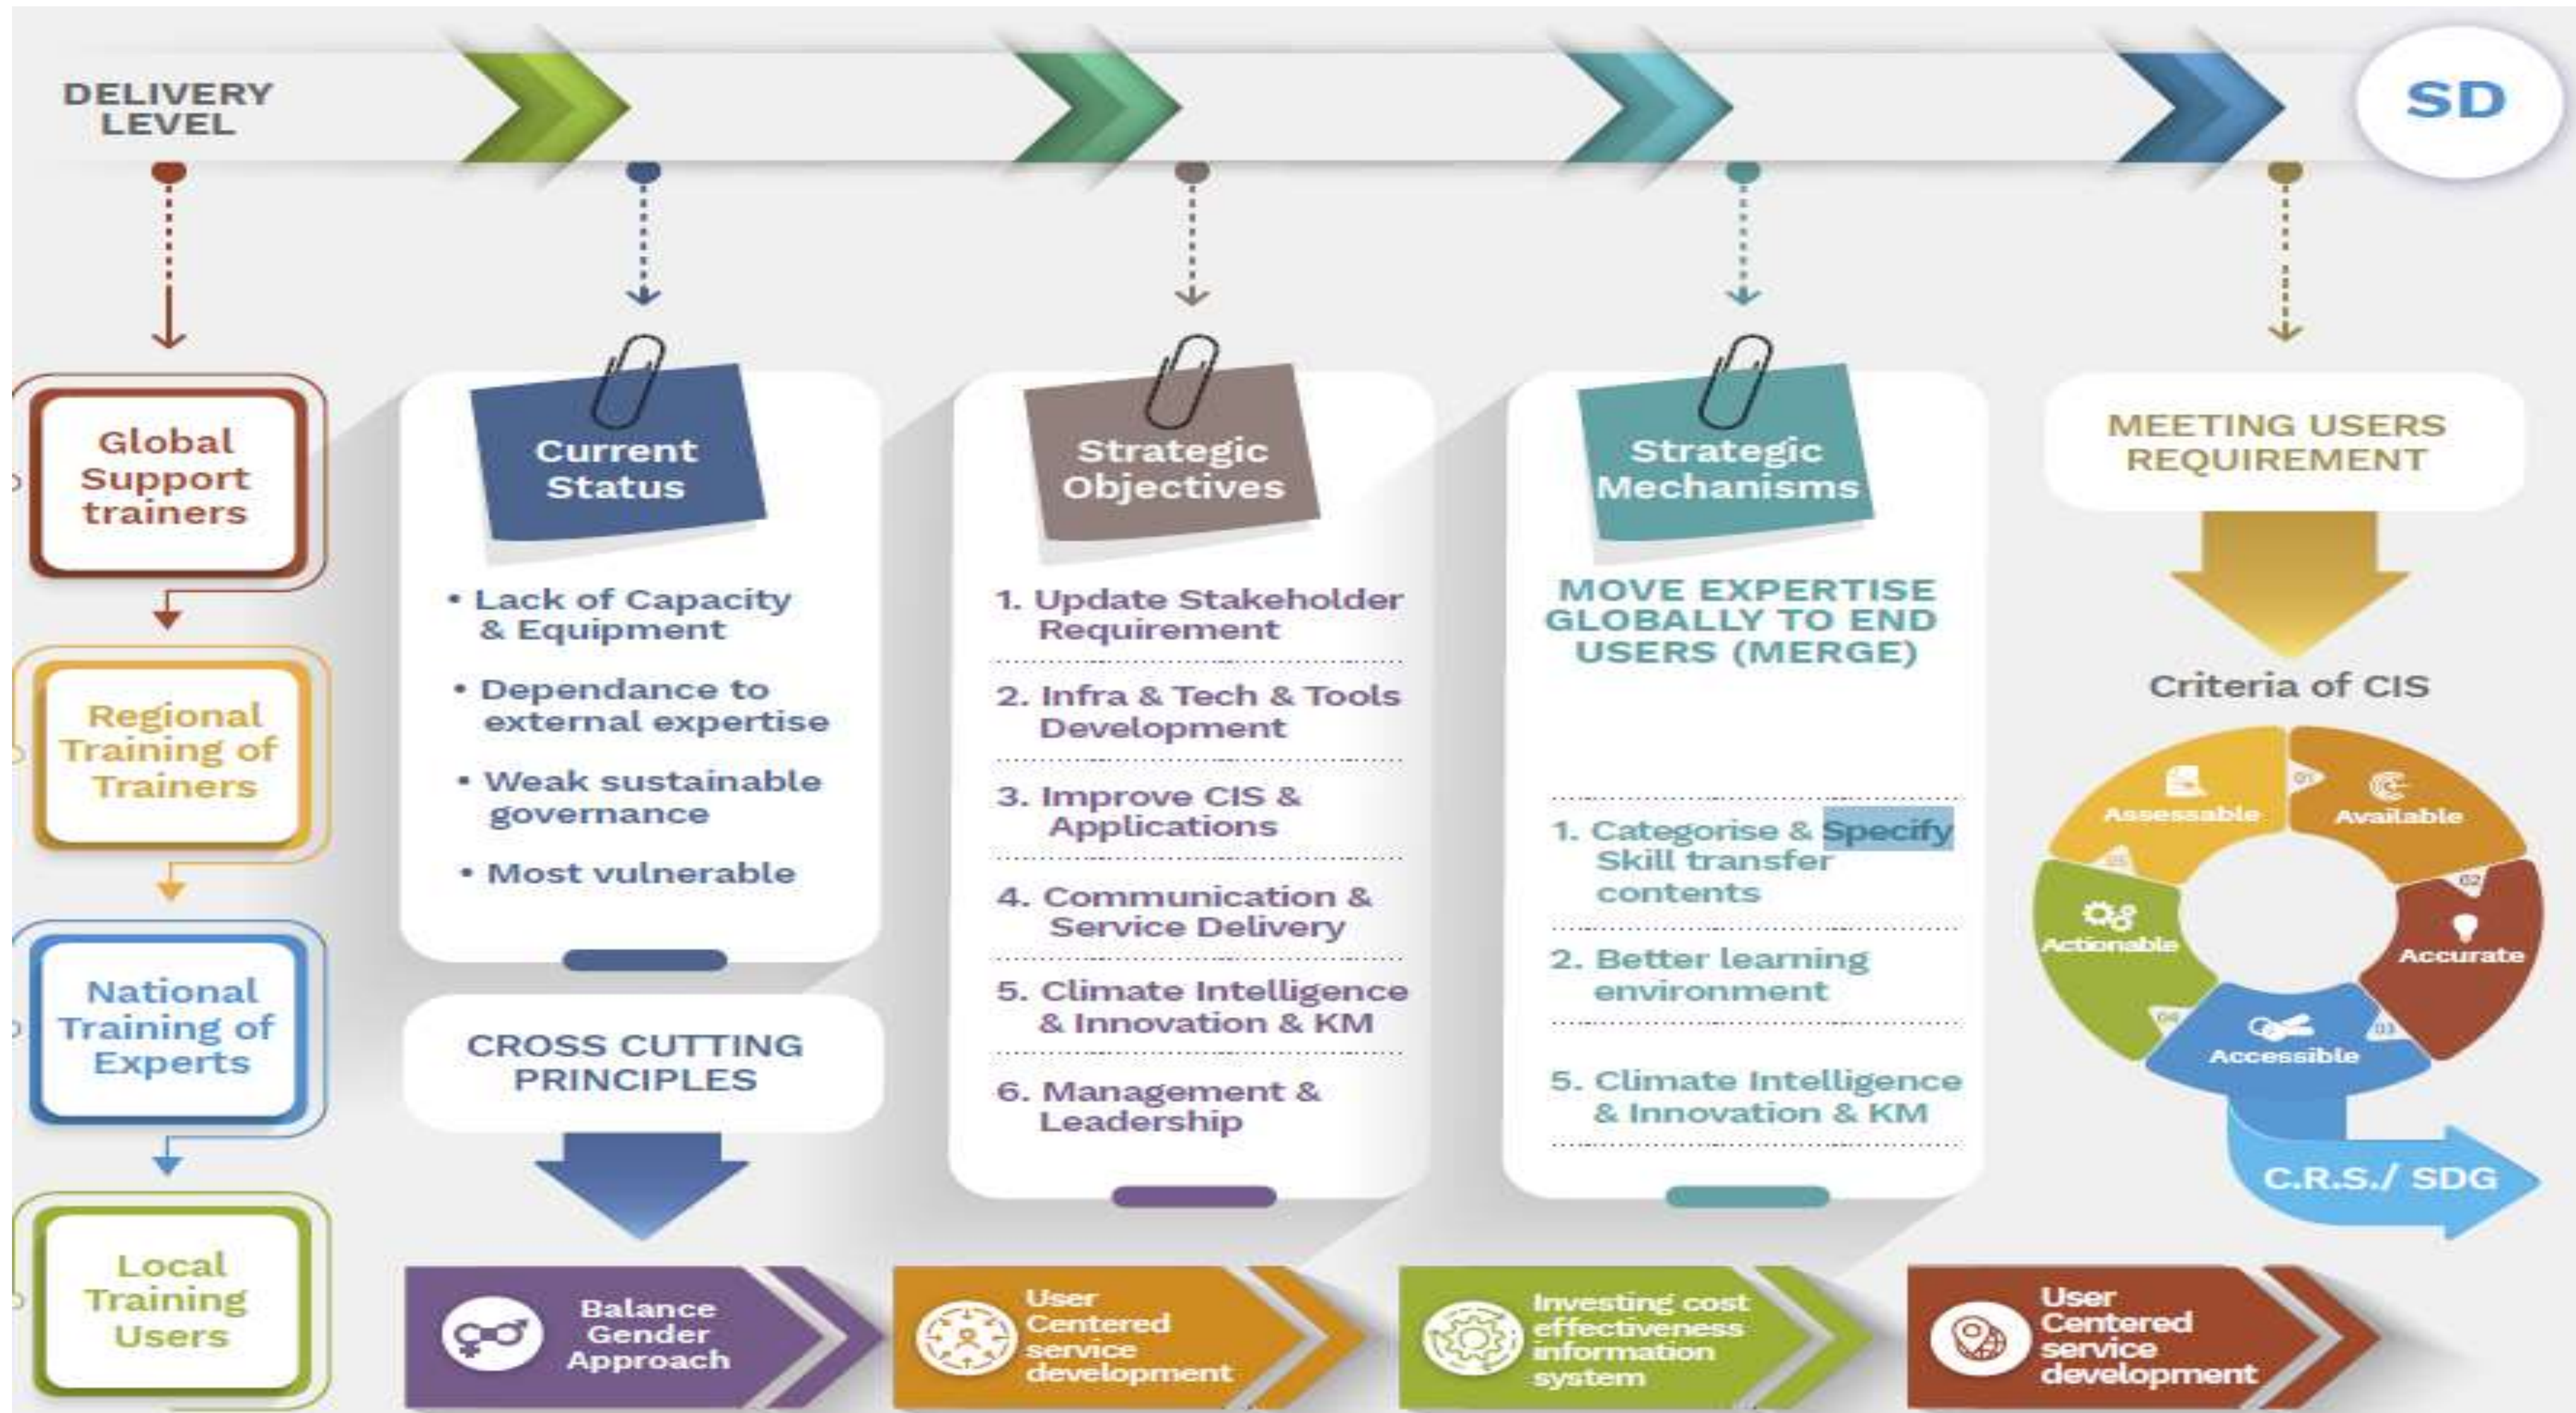

Policymakers, businesses, and communities are increasingly seeking climate-related information that is tailored, relevant, and actionable. Climate services must evolve to deliver more granular, user-friendly data and decision-support tools to meet this growing demand.

Transitioning to a Low-Carbon Economy

The global shift towards a low-carbon economy is driving the need for climate services that can support sustainable decision-making, emissions monitoring, and the development of climate-friendly technologies and strategies.

FIGURE 1: Theory of Change

Emerging Technologies Transforming the Sector

Earth Observation

Advancements in satellite technology and remote sensing are revolutionizing the collection and analysis of climate data, providing more comprehensive and accurate information for climate services.

Big Data and Analytics

The ability to process and interpret vast amounts of climate data using sophisticated analytics and machine learning algorithms is enabling more precise forecasting, risk assessment, and decision-support tools.

Cloud Computing

Cloud-based platforms are making it easier to store, access, and share climate data and services, facilitating collaboration and the development of innovative climate applications.

Mobile and Web-based Solutions

User-friendly mobile apps and web-based platforms are bringing climate information and services directly to the fingertips of stakeholders, improving accessibility and engagement.

Leveraging Innovative Technologies

Earth Observation

Satellite data and remote sensing technologies can provide invaluable insights into climate patterns and environmental dynamics to inform climate services.

Advanced Analytics

Applying cutting-edge data analytics, machine learning, and artificial intelligence can enhance the accuracy and usability of climate services.

User-Centric Platforms

Developing intuitive, user-friendly platforms and mobile applications can improve the accessibility and uptake of climate services by diverse end-users.

Cloud-based Solutions

Cloud computing and cloud-based tools can facilitate the scalability, flexibility, and cost-effectiveness of climate service delivery.

Embedding Climate Services within Decision-making Processes

1

Identify Decision Needs

Understanding the specific information requirements and decision-making contexts of various stakeholders is crucial for designing climate services that are tailored and actionable.

2

Integrate into Workflows

Embedding climate services seamlessly into the existing workflows and decision-making processes of end-users can ensure their regular use and promote evidence-based decision-making.

3

Iterative Improvement

Continuously evaluating the impact and relevance of climate services, and adapting them based on user feedback, can lead to more effective and sustainable decision-support tools.

FIGURE 7: Meeting Users Requirements

03

IMPLEMENTED ACTION PLAN

Showcasing Best Practices and Success Stories

1

Innovative Applications

- Development of ClimSA station;
- Climate services for Renewable Energy;
- SEB tool development .

2

Effective Partnerships

Synergy with EU Horizon programme: NOA, Neurali AI, ECMWF

Universities for Master programme: ICPAC, AGRHYMET, CAPC

3

Capacity-Building Initiatives

Foundational training (ICPAC)

Pre-RCOF trainings

Job-training at ACMAD.

The Path Forward: Roadmap for Climate Services Innovation

Enhance Data Integration Improve data interoperability, standardisation, and accessibility to provide a more comprehensive and cohesive view of climate information.

Advance Analytical Capabilities Leverage emerging technologies, such as artificial intelligence and machine learning, to enable more accurate forecasting, risk assessment, and decision-support tools.

Foster Collaborative Ecosystems Facilitate stronger partnerships and knowledge-sharing among public, private, and civil society actors to drive innovative climate solutions.

Invest in Capacity Building Develop interdisciplinary training programs and upskill the climate services workforce to ensure the availability of the necessary expertise.

Enhance User Engagement Improve the usability and accessibility of climate services to better meet the needs of a diverse range of stakeholders.
